

How to Use and Maintain the Distribution Macro

This macro acts as an automated filing system. It reviews the list of trades on the main entry sheet and instantly copies each trade into its respective monthly sheet, creating a copy for every single month within the trade's term. Once the transfer is successful, it clears the entry sheet for the next batch.

1. Data Organization Requirements

For the macro to function properly, your **"Data Entry"** sheet must be organized with these specific columns:

- **Column A:** Trade Date
- **Column B:** Deal Number
- **Column C:** Volume
- **Column D:** Market Diff
- **Column E:** Trade Term *(Note: The macro relies entirely on this column to distribute the data)*
- **Column F:** Trade Type
- **Column G:** Book Strategy

2. Formatting the Trade Term (Column E)

The macro completely ignores columns A, B, C, D, F, and G when doing its calculations. It ONLY reads **Column E (Trade Term)** to determine which monthly sheets receive the data.

- **The Required Format:** You must type the term with a 3-letter month, a space, a 2-digit year, a hyphen, and the end date.
 - *Example:* Mar 26 - Dec 27
- **Future Years:** You do not need to edit the macro for new or future years. Whether the year is 27, 30, or 45, the macro will automatically calculate the months and look for the matching sheets (e.g., "Mar 26", "Apr 26", etc.).

3. How to Set Up a Keyboard Shortcut

To make running this macro as efficient as possible, you can assign it a keyboard shortcut. You only need to do this once.

1. Open your Excel spreadsheet.

2. Press **ALT + F8** on your keyboard to open the Macro menu.
3. Click on the macro named **DistributeDataToMonths** so it is highlighted.
4. Click the **Options...** button on the right side of the menu.
5. A small box will appear asking for a "Shortcut key". Click inside the white box and press **Shift + M**. (It will now display as Ctrl+Shift+M).
6. Click **OK**, then close the Macro menu.

Whenever you finish typing your new trades into the Data Entry sheet, press **Ctrl + Shift + M**. The macro will instantly distribute the data and clear the board.

4. Troubleshooting Guide

If the macro is not performing as expected, review the following common issues. The macro is built with safety checks to prevent workbook crashes and will typically skip a row rather than execute an error.

Issue: The macro finished, but a row of data was skipped and left behind on the "Data Entry" sheet. If a trade did not move over to the monthly sheets, the macro likely could not parse the date correctly.

- **Verify spelling in Column E:** Ensure you are using the exact 3-letter abbreviation and a 2-digit year (e.g., Mar 26 - Dec 27). Verify that the hyphen - is present between the dates.
- **Verify destination sheet names:** The macro looks for exact matches. If the macro is looking for "Jan 27", but the destination sheet is named "Jan 2027" or "Jan 27" (with a double space), the macro will skip it to avoid misfiling the data.

Issue: A pop-up appears stating "No data found to distribute."

- **Check Column E:** The macro scans down Column E to calculate how many rows of data exist. If a trade is entered but Column E is left blank, the macro assumes the list is empty and halts. Trade Terms must always be filled in.

Issue: The macro copied the data, but it overwrote an older trade on the monthly sheet.

- **Check Column A:** When pasting a new trade onto a sheet (like "Jan 27"), the macro scans down Column A (Trade Date) to find the first empty row. If previous entries are

missing a Trade Date, Column A will be blank, and the macro will overwrite that row. Always ensure Column A contains data.

Issue: The shortcut was accidentally triggered on a blank sheet.

- The macro has a built-in safety protocol. If it does not detect at least one valid trade in row 2, it will display a warning message and terminate without altering any data.
-

5. Editing the Code (For Administrators)

Because the code handles dates and math automatically, there are only two scenarios where the macro's code would need to be manually updated:

Scenario A: The "Data Entry" sheet is renamed. If the name of the main input tab is changed, the macro will fail to locate it.

1. Press **ALT + F11** to open the code editor.
2. Locate the line: `Set wsSource = ThisWorkbook.Sheets("Data Entry")`
3. Replace Data Entry with the exact new sheet name.

Scenario B: Columns are added, shifting the "Trade Term" column. If a new column is inserted (e.g., between B and C), the "Trade Term" will shift from Column E (the 5th column) to Column F (the 6th column).

1. Press **ALT + F11** to open the code editor.
2. Locate the line: `lastRow = wsSource.Cells(wsSource.Rows.Count, "E").End(xlUp).Row`
3. Change the "E" to your new column letter.
4. Locate the line: `colDate = wsSource.Cells(r, 5).Value`
5. Change the 5 to your new column number (A=1, B=2, C=3, etc.).
