

Overwatch Player Rating Equations

Variables

A - assist

De - Deaths

D - Damage

K - Kills

H - Healing

T - Total Time Played (All matches)

WL = Win Loss (Win Rate)

R = Rating

To calculate averages take the total amount of X variable and divide it by their time played into averages of 10 minutes

Rules Support (All values measured in per 10 minutes)

10,000 Healing = 100 Rating for every 1,000 below rating will decrease by 5

15 Assist = 100 Rating for every drop rating by 1 for every 3 kills below

12 Kills = 100 rating every 2 kills less drop rating by 3

5,000 Damage = 100 rating drop rating by 1 for every 1,000 below

7 Deaths = 100 rating drop rating by 2 for every death higher than 7

W / L = 90% Win rate is 100 rating drop rating by 1 for every 5% lower

Rating Equation Support

$HR = (H/100) - 5 * ((13,000 - H) / 1,000)$, if $H < 13,000$

$AR = ((A*100) / 15) - ((15-A) / 3)$, if $A < 15$

$KR = ((K*100)/12) - 3 * ((12-K)/2)$, if $K < 12$

$DR = ((D*100) / 5,000) - ((5,000 - D) / 1,000)$ if $D < 5,000$

$DeR = 100 - 2 * (De-7)$, if $De > 7$

$WR = 100 - ((90 - W/L * 100) / 5)$

Rating Before Normal = $HR+AR+KR+DR+DP+ WLR$

Assume all ratings are max rating or 100 = $100(HR)+100(AR)+100(KR)+100(DR)+100(DP)+100(WR) = 600$

Normalized Rating = $(Player Rating / 600) * 100$

Rules DPS (All values measured in per 10 minutes)

Healing Exclude

17 Kills 10 = 100 rating for every 1 kill below rating decreases by 3

15 Assist = 100 rating for every 1 assist below rating decreases by 2

12,000 Damage = 100 rating for every 1k below rating decreases by 3

7 deaths = 100 rating drop rating for every 2 above

W / L = 90% Win rate is 100 rating drop rating by 1 for every 5% lower

Rating Equation DPS

$KR = ((K * 100) / 17) - 3 * ((17 - K) / 2)$, if $K < 12$

$AR = 100 - 2 * (20 - A)$, if $A < 20$

$DR = 100 - 3 * ((12,000 - D) / 1,000)$, if $D < 12,000$

$DeR = 100 - 2 * (De - 7)$, if $De > 7$

$WR = 100 - ((90 - W/L * 100) / 5)$

Rating Before Normal = $KR + AR + DR + DeR + WR$

To find normal assume all ratings are 100 = $100 KR + 100 AR + 100 DR + DeR + 100 WR$

Normalized Rating = $(\text{Player Rating} / 500) * 100$

Rules Tank (All values measured in per 10 minutes)

Healing Excluded

16 Kills = 100 every 1 below drop by 4 rating

18 Assist = 100 every 1 below rating drops by 2

10,000 Damage = 100 every 1k below decrease by 2

5 Deaths = 100 every 1 above rating decreases by 3

W / L = 90% Win rate is 100 rating drop rating by 1 for every 5% lower

Rating Equation Tank

$((K * 100) / 16) - 4 * ((16 - K) / 2)$, if $K < 12$

$AR = 100 - 2 * (18 - A)$, if $A < 18$

$DR = 100 - ((10,000 - D) / 1,000)$, if $D < 10,000$

$DeR = 100 - 3 * (De - 5)$, if $De > 5$

$WR = 100 - ((90 - W/L * 100) / 5)$

To find normal assume all ratings are 100 = $100 KR + 100 AR + 100 DR + 100 DeR + 100 WR$

Normalized Rating = $(\text{Player Rating} / 500) * 100$
